Prince George’s County Rain Check Rebate Program

Request for Applications

Chesapeake Bay Trust

108 Severn Avenue, Annapolis, MD 21403

(410) 974 - 2941  ♦  www.cbtrust.org
At A Glance

Program Summary:
The Prince George’s County Rain Check Rebate Program offers rebate incentives to property owners to install practices that will reduce stormwater runoff, reduce pollution, and improve local stream and river health.

Deadline:
Applications are accepted on a rolling basis.

Eligible Project Types:
Rain barrels, cisterns, rain gardens, urban tree canopy, pavement removal, permeable pavement, and green roofs.

Eligible Project Locations:
This program funds projects in Prince George’s County, Maryland. Properties within the City of Bowie are not eligible for this program (see City’s program). Properties within the Town of Cheverly, Town of University Park, and City of College Park are not eligible for urban tree canopy projects (see your local program for tree planting).

Eligible Applicants, Property Types, and Maximum Rebate Amounts:
The applicant must be the property owner or a nonprofit organization installing a project on public property. Each of the eligible project types has a maximum rebate amount allowed and criteria that must be met. The total maximum rebate amounts for the lifetime of the property are:

- $6,000 for residential properties
- $20,000 for commercial, industrial, and institutional properties
- $20,000 annually for nonprofit organizations to install projects on public property

Submit Your Application:
Go to https://cbtrust.org/grants/prince-georges-county-rain-check-rebate/ to submit an online application.

Introduction

The Chesapeake Bay Trust (the Trust) is proud to partner with Prince George’s County on its Rain Check Rebate Program. Prince George’s County is committed to improving the quality of life for its communities by promoting green solutions to stormwater runoff. Stormwater runoff occurs when rain (or snowmelt) flows over the land picking up pollutants such as oil, grease, sediment, and nutrients that make their way into local streams and rivers.

The Trust is a nonprofit, grant-making organization dedicated to improving the bays, streams, rivers, forests, parks, and other natural resources of our local systems, from the Chesapeake to the Coastal Bays to the Youghiogheny River. The Trust, supported in large part by Maryland’s Chesapeake Bay License Plate, Plate and partnerships with other regional funders, engages and empowers diverse groups to take actions that enrich natural resources and local communities of the Chesapeake Bay region. Since 1985, the Trust has awarded over $120 million in grants to municipalities, nonprofit organizations, schools, and public agencies throughout the Chesapeake Bay watershed.

Program Goals

The Rain Check Rebate Program offers rebate incentives to homeowners, businesses, and others to install practices that will improve stormwater runoff quality, reduce pollution, and improve local stream and river health. The goal of this program is to treat impervious cover in the County. Funds for the program are provided by Prince George’s County and the Clean Water Act Fee (supported by County residents).

Eligible Applicants, Property Types, and Project Locations

An applicant must be the property owner or a nonprofit organization with an agreement to complete a project on public property. Applicants are not eligible for a rebate under this program if the project is part of the permit approval requirements for new building construction or renovations.

The following entities are eligible to participate in the Rain Check Rebate Program:

- Residential Property Owners
  - Individual residences
  - Individual members of housing cooperative
- Commercial, Industrial, and Institutional property owners
  - Multi-family dwellings
  - Homeowner Associations
  - Condominium Associations
  - Civic Associations
  - Nonprofit organizations
  - Businesses
- Nonprofit organizations installing a project on public property (Nonprofit organizations established pursuant to Section 501 (c)(3) of the Internal Revenue Code)

What is a rebate?
A rebate is a partial or full refund that is provided by the County to the property owner after the pre-approval, purchase, installation, and final inspection of the Rain Check Rebate practice. The rebate amount is dependent on the type of practice installed, the property type, final project size, and receipts/invoices. The applicant will typically receive a check in the mail within six to eight weeks after final approval by the County.
Property owners within Prince George’s County, Maryland, are eligible to participate with the following exceptions:

- The City of Bowie manages its stormwater program independently of the County. Therefore, properties within the City of Bowie are not eligible for this program.
- The Town of Cheverly, Town of University Park, and City of College Park offer their own tree rebate programs and therefore properties within these Towns and the City while eligible for rain barrel, cistern, rain garden, permeable pavement, pavement removal, and green roof rebates through this program are not eligible for urban tree canopy projects through this program. Applicants are encouraged to contact their Town or City’s Department of Public Works to participate in their tree planting programs.

Property owners within the City of Bowie, Town of Cheverly, Town of University Park, and City of College Park, please check back into this program for possible future updates on the status of availability to participate.

Eligible Practices/Project Types and Criteria

Seven types of stormwater practices are eligible for rebates under the Rain Check Rebate Program. These seven practices are defined on the following pages. The seven practices include: rain barrels, cisterns, rain gardens, urban tree canopy, pavement removal, permeable pavement, and green roofs. Each project must meet the practice’s criteria and minimum project size requirements (Table 1) to qualify for a rebate. In addition, to learn about each practice including details about the seven stormwater practices to help decide what may work best for you as well as what steps are needed to attain a rebate and what is allowable in the program, applicants should review the fact sheet and guidelines document for each practice which can be found at [https://cbtrust.org/grants/prince-georges-county-rain-check-rebate/](https://cbtrust.org/grants/prince-georges-county-rain-check-rebate/). Knowing about the use of each practice and how to maintain them so they look beautiful and continue to function as designed is important; see Appendix A for details on operation and maintenance of the seven Rain Check Rebate practices.

**Rain Barrels**

Rain barrels (Figures 1, 2, and 3) are containers used to collect a portion of the rainwater that flows from your rooftop and stores it for later use such as on your lawn and garden. Rain barrels are not for storing drinking water or water for use inside your home. By capturing water from downspouts that would otherwise discharge onto a paved surface, rain barrels can reduce the amount of runoff and pollutants reaching local streams.

For residential and housing cooperative properties, the rain barrel system must capture at least 50 gallons of rainwater. For all other property types, the rain barrel system must capture at least 100 gallons of rainwater.

![Figure 1. A 55-gallon rain barrel installed at a residential property.](image1)

![Figure 2. A 50-gallon rain barrel with a rain chain installed at a residential property.](image2)

![Figure 3. Four 50-gallon rain barrels connected together and installed at a residential property.](image3)
Cisterns
A cistern (Figures 4 and 5) is a sealed tank used to collect rainwater that flows from your rooftop and stores it for non-potable, exterior uses, such as landscape irrigation and car washing. Generally larger than rain barrels, cisterns have capacities ranging from 100 gallons to several thousand gallons and can collect water from several downspouts from a single roof or from multiple roofs.

For all property types, the cistern must capture at least 250 gallons of rainwater.

Figure 4. Four 305-gallon cisterns connected together and installed at a residential property.

Figure 5. A 250-gallon cistern installed at a nonprofit organization.

Rain Gardens
A rain garden (Figures 6 and 7) is a planted shallow depression that uses water-tolerant native plants and landscaping to treat stormwater flowing from downspouts or hard (impervious) surfaces, such as your driveway, patio, or sidewalk. Rain gardens allow water to slowly soak into the ground, reducing the amount of water that flows directly into nearby storm drains, creeks, or rivers. Rain gardens are an aesthetically attractive, low-tech, and inexpensive way for homeowners, communities, and businesses to help reduce stormwater pollution in local streams and rivers.

For all property types, the rain garden must:

- be at least 100 square feet in size;
- be at least 10 feet away from all structures;
- be located downhill from the foundations of any structures;
- drain water away from your home and your neighbors’ home;
- be at least 25 feet away from a septic field or a wellhead;
- be exposed to full or partial sun; and
- be in an area in which water can seep quickly enough into the soil so that it drains within 36 hours.

Figure 6. A 225 square foot rain garden installed at a residential property.

Figure 7. A 360 square foot rain garden installed at a residential property.
Urban Tree Canopy

The canopy of a tree or group of trees is the area of leaves and branches that create shade under the tree(s). Like umbrellas, trees reduce the amount of sunlight and rain reaching the ground. Trees (Figures 8 and 9) in urban environments are particularly important for intercepting rainfall before it becomes stormwater runoff. Tree leaves, branches, and roots intercept falling rain, filter out pollutants, and absorb stormwater.

For all property types, the following criteria must be met:

- New trees must be planted on private property (not in the public right-of-way);
- Trees must be planted between October 1 and May 1;
- Trees must be native species with the exception of ash (*Fraxinus* species), which is not recommended due to the spread of the invasive emerald ash borer, an insect that kills ash trees;
- At the time of planting, trees must be at least 5 feet tall at least ½ inch caliper, and planted in a 5-gallon (or larger) container or balled and burlapped; and
- Trees should be species that grow greater than 25 feet tall at maturity (“shade trees”); however, where larger trees are not appropriate due to spacing and property size, smaller native trees may be used.

![Image 1](image1.png)  
*Figure 8. Six arborvitae (Thuja occidentalis) trees planted at a residential property.*

![Image 2](image2.png)  
*Figure 9. A southern magnolia (Magnolia grandiflora) tree planted at a residential property.*

Pavement Removal

Pavement removal (Figure 10) is the replacement of impervious surfaces (such as asphalt and concrete) with grass, native plants, or with permeable pavement and/or pavers. Instead of soaking into the soil (infiltrating) and replenishing groundwater, rainfall that lands on driveways, sidewalks, and other impervious surfaces rapidly accumulates in the form of runoff, which often contains pollutants (nutrients, sediment, chemicals, animal waste, trash, etc.). In urbanized areas, stormwater runoff typically enters the storm drain system (underground pipes that carry stormwater to streams) and ultimately, flows to the Chesapeake Bay. Large expanses of impervious area are also associated with increased stream bank erosion and decreased water quality.

For residential and housing cooperative properties, there is no minimum size requirement for pavement removal. For all other property types, a minimum of 400 square feet of pavement must be removed.
Permeable Pavement

When rainwater falls on conventional pavement, such as concrete, it flows over this impervious surface as stormwater runoff. Permeable pavement (Figures 11, 12, and 13) allows stormwater to slowly soak through the surface (infiltrate), reaching the soil and groundwater. When water infiltrates the soil, water quality is improved and stormwater pollution and stream bank erosion decrease. A variety of permeable pavement materials are available; however, gravel does not qualify as a permeable pavement for this program.

For residential and housing cooperative properties, there is no minimum size requirement for permeable pavement. For all other property types, a minimum of 400 square feet of permeable pavement must be installed.

Green Roof

A green roof (Figure 14) is a low-maintenance, vegetated roof system that stores rainwater in a lightweight, engineered soil medium. The stored water either evaporates from the roof top or is taken up by plants. As a result, compared to a conventional rooftop of the same area, much less water runs off of a green roof.

For all property types, a minimum of a ¼ roof retrofit must be completed to qualify for a rebate. The green roof must replace an existing traditional roof area rather than expanding the original roof footprint. A structural load analysis report from a licensed structural engineer is required for approval.

Rebate Allowable Costs and Maximum Rebate Amounts

**Rebate Allowable Costs**

Each of the seven practices supported by the Rain Check Rebate Program has its own rebate allowance (Table 2). In addition, there is a total maximum rebate amount for the lifetime of the property based on the property type for each property parcel (Table 3). An applicant may complete multiple projects until the total maximum rebate amount for the lifetime of the property is met.

The rebate amount will be dependent upon final project size and receipts/invoices for costs associated with the project. The rebate amount will be the maximum rebate allowed or the actual costs, whichever is lower. A rebate request cannot exceed the cost of the project.
Only costs associated with the stormwater functions of a project are eligible for reimbursement. Related structural features of a project that do not directly play a role in the treatment of stormwater are not eligible for a rebate (e.g., benches, decorative items such as boulders, walkways, bridges, and other similar items that do not support the stormwater function of the project). Itemized, detailed receipts and invoices must be submitted to the Trust upon the completion of the project. Receipts should only include costs associated with the project or be clearly marked to indicate costs associated with the project. For property owners that implement the project on their own, please contact the Trust to confirm allowable and unallowable costs prior to purchasing.

Applicants are not eligible for a rebate under this program if the project is part of the permit approval requirements for new building construction or renovations or if the property is located within a municipality that has a similar rebate program for stormwater management projects.

**Maximum Rebate Amounts per Property Type and per Practice for Each Property Type**

**Residential Property Owners**

**Total Maximum Rebate Amount for the Property:** Individual residential properties including individual residences of a housing cooperative are eligible to receive a lifetime maximum rebate amount of up to $6,000 for each property parcel (i.e., each property tax account number).

**Maximum Request Amount for Practices Installed on Residential Property:** Individual residential property owners or individual members of a housing cooperative are eligible to receive $2 per gallon stored for rain barrels and cisterns, $10 per square foot for rain gardens, $150 per tree, $6 per square foot for pavement removal, $12 per square foot for permeable pavement, and $10 per square foot for green roofs. In addition, some of the seven Rain Check Rebate practices have a minimum project size requirement. Refer to the “Eligible Practices/Project Types and Criteria” section above for details. An applicant may complete multiple projects until the total maximum rebate amount for the lifetime of the property is met.

**Commercial, Industrial, and Institutional Property Owners**

This includes multi-family dwellings, homeowner associations, condominium associations, civic associations, nonprofit organizations, and businesses.

**Total Maximum Rebate Amount for the Property:** The property types listed above are eligible to receive a maximum lifetime rebate amount of up to $20,000 for each property parcel (i.e., each property tax account number).

**Maximum Request Amount for Practices Installed on Commercial, Industrial, and Institutional Property (including the ones listed above):** Property owners of these property types are eligible to receive $2 per gallon stored for rain barrels and cisterns, $10 per square foot for rain gardens, $150 per tree, $6 per square foot for pavement removal, $12 per square foot for permeable pavement, and $10 per square foot for green roofs if less than 6 inches of planting material or $20 per square foot for green roofs if over 6 inches of planting material. In addition, all seven of the Rain Check Rebate practices have a minimum project size requirement. Refer to the “Eligible Practices/Project Types and Criteria” section above for details. An applicant may complete multiple projects until the total maximum rebate amount for the lifetime of the property is met.

**Nonprofits Installing Rain Check Rebate Projects on Public Property**

**Total Maximum Rebate Amount for a Nonprofit Installing Rain Check Rebate projects on Public Property:** Nonprofit organizations established pursuant to Section 501(c)(3) of the Internal Revenue Code may annually perform community projects up to $20,000 that the Prince George’s County Department of Environment determines to be an eligible use of the funds. Community projects consist of stormwater management practices that benefit the community and are located on public property.
Maximum Request Amount for Practices that a Nonprofit Installed on Public Property: Nonprofits installing a Rain Check Rebate project on public property are eligible to receive $2 per gallon stored for rain barrels and cisterns, $10 per square foot for rain gardens, $150 per tree, $6 per square foot for pavement removal, $12 per square foot for permeable pavement, and $10 per square foot for green roofs if less than 6 inches of planting material or $20 per square foot for green roofs if over 6 inches of planting material. In addition, all seven Rain Check Rebate practices have a minimum project size requirement. Refer to the “Eligible Practices/Project Types and Criteria” section above for details.

### Timeline

Projects must be completed within 12 months from the date that the application was submitted. Requests to extend project completion period are often allowed and will be reviewed on a case-by-case basis.

### Deadline

Applications for the Rain Check Rebate Program are accepted on an on-going basis (also called a “rolling program”). Funds are available on a first come, first served basis until funds are fully expended for the given fiscal
year. Check our website at https://cbtrust.org/grants/prince-georges-county-rain-check-rebate/ and sign up for our grantee newsletter at https://cbtrust.org/newsletters/ for the most up to date information about the status of this rolling program.

Application Process

Here are the steps that start with your project idea for one or more Rain Check Rebate practices to be installed using the Rain Check Rebate Program through the application process, including major milestones expected, and ending with the project completed with rebate payment. The steps are broken up for you by property type.

Residential Property Owners

1. Determine which practices you want to install on your property and review the fact sheet and guidelines documents for the practices at https://cbtrust.org/grants/prince-georges-county-rain-check-rebate/. If you are unsure which practice(s) might be suitable, submit an application with estimates. The Trust’s Rain Check Rebate Coordinator will help you finalize the practice types and sizes during a site visit.

2. Submit an application at https://cbtrust.org/grants/prince-georges-county-rain-check-rebate/. To be eligible for a rebate, applicants must submit an application and for all projects, except rain barrels, be pre-approved prior to implementation. Applicants seeking rebates for rain barrel projects may apply for a rebate for up to 12 months after installation. Applications are processed on a first come, first served basis, and are typically reviewed by the Rain Check Rebate Coordinator within two weeks of submitting the application. Upon completion of the review, the applicant will receive an email from the Rain Check Rebate Coordinator with next steps.

3. The Rain Check Rebate Coordinator will schedule a pre-installation site visit for all projects except rain barrels. The applicant is required to be present at the site visit.

4. Submit any contingencies (required supporting documents and project information) to receive pre-approval from the Rain Check Rebate Coordinator. Examples of required supporting documents and project information include a signed property owner and maintenance agreement, site photos, rain garden sketch and plant list, and permeable pavement design plan. In addition, if the property is part of a homeowners association, condominium association, or civic association, the applicant must provide a letter of approval for the project from the association. Upon receipt, review, and approval of the contingencies, the applicant will receive an email with their pre-approval for the project. All projects, except for rain barrels, must be pre-approved prior to implementation. Applicants should not begin work on their project until they receive pre-approval (except for rain barrel projects).

5. Apply for permits, if required. Most projects will not require permits. However, if a project on its own or in conjunction with a concurrent project on your property involves any of the following activities, a permit is likely required:
   a. 5,000 square feet or more of ground is disturbed,
   b. 100 cubic yards or more of earth moving occurs, or
   c. 12-inch change (+/-) in grade that alters drainage flow.

   Visit the County Department of Permits, Inspections, and Enforcement website at https://www.princegeorgescountymd.gov/1024/Permitting-Inspections-and-Enforcement.

6. Complete the project within 12 months of your application submission and submit all receipts, invoices, copies of final permit inspections (if applicable), and any other required project information upon completion of the project to the Rain Check Rebate Coordinator.
7. The applicant contacts the Rain Check Rebate Coordinator to schedule a post-installation site visit to inspect the completed project.

8. Receive a rebate check from Prince George’s County.

**Commercial, Industrial, and Institutional Property Owners and Nonprofit Organizations Installing a Project on Public Property**

This includes multi-family dwellings, homeowner associations, condominium associations, civic associations, nonprofit organizations, and businesses.

1. Determine which practices you want to install on the property and review the fact sheet and guidelines documents for the practices at [https://cbtrust.org/grants/prince-georges-county-rain-check-rebate/](https://cbtrust.org/grants/prince-georges-county-rain-check-rebate/). If you are unsure which practice(s) might be suitable, submit an application with estimates. The Trust’s Rain Check Rebate Coordinator will help you finalize the practice types and sizes during a site visit.

2. Submit an application at [https://cbtrust.org/grants/prince-georges-county-rain-check-rebate/](https://cbtrust.org/grants/prince-georges-county-rain-check-rebate/). To be eligible for a rebate, applicants must submit an application and for all projects, except rain barrels, be pre-approved prior to implementation. Applicants seeking rebates for rain barrel projects may apply for a rebate up to 12 months after installation. Applications are processed on a first come, first served basis, and are typically reviewed by the Rain Check Rebate Coordinator within two weeks of submitting the application. Upon completion of the review, the applicant will receive an email from the Rain Check Rebate Coordinator with next steps.

3. The Rain Check Rebate Coordinator will schedule a pre-installation site visit for all projects except rain barrels. The applicant is required to be present at the site visit.

4. For project requests above $6,000, the Trust and the County will confirm eligibility of the project and availability of program funds. The applicant will be notified of eligibility and afterwards, will be required to submit any contingencies (required supporting documents and project information) to receive pre-approval from the Rain Check Rebate Coordinator. Examples of required supporting documents and project information include a signed property owner and maintenance agreement, site photos, rain garden sketch and plant list, and permeable pavement design plan. In addition, if the property is part of a homeowners association, condominium association, or civic association, the applicant must provide a letter of approval for the project from the association. Upon receipt, review, and approval of the contingencies, the applicant will receive an email with their pre-approval for the project. All projects, except for rain barrels, must be pre-approved prior to implementation. Applicants should not begin work on their project until they receive pre-approval (except for rain barrel projects).

5. Apply for permits, if required. Most projects will not require permits. However, if a project on its own or in conjunction with a concurrent project on your property involves any of the following activities, a permit is likely required:
   a. 5,000 square feet or more of ground is disturbed,
   b. 100 cubic yards or more of earth moving occurs, or
   c. 12-inch change (+/-) in grade that alters drainage flow.

Visit the County Department of Permits, Inspections, and Enforcement website at [https://www.princegeorgescountymd.gov/1024/Permitting-Inspections-and-Enforcement](https://www.princegeorgescountymd.gov/1024/Permitting-Inspections-and-Enforcement).

6. Complete the project within 12 months of submitting your application and submit all receipts, invoices, copies of final permit inspections (if applicable), and any other required project information upon completion of the project to the Rain Check Rebate Coordinator.
7. The applicant contacts the Rain Check Rebate Coordinator to schedule a post-installation site visit to inspect the completed project.

8. Receive a rebate check from Prince George’s County.

Contact the Chesapeake Bay Trust’s Rain Check Rebate Coordinator at (410) 974-2941 or rebate@cbtrust.org.

Application Submission Instructions

Online Application

The Trust uses an online system for the application process and project management. Go to https://cbtrust.org/grants/prince-georges-county-rain-check-rebate/ and click on “Get Started” to begin a new application. This will open a new window asking you to log in or create an account on our online system. If you have applied to the Chesapeake Bay Trust in the past, please use your existing username and password (if you have forgotten your password, click on ‘forgot password’ to reset your password). If you have not applied to the Chesapeake Bay Trust before, click on “New Applicant” to set up an account.

At the start of the online application form, you will be asked to complete an eligibility review which is meant to assist you in determining if your project meets the requirements of this program. You will then be asked to provide the following information. Complete the application to the best of your ability.

1. Applicant and Property Information Tab
   o Provide the property owner’s name, mailing address, phone, and email address. The applicant must be the property owner.
   o Provide the property information including the property tax account number, address, and type. If the property type is residential, indicate if it is part of a Homeowners Association. If the property type is not residential, provide the organization or business name and the tax ID number.

2. Project Information Tab
   o Provide the Rain Check Rebate practice(s)/project type(s), project goal(s), project start and end dates, and estimated rebate amount requested.

3. Supporting Documents Tab
   o Upload a signed copy of the Property Owner Agreement form. This form can be downloaded from our website at https://cbtrust.org/grants/prince-georges-county-rain-check-rebate/.
   o Upload photos of the site prior to implementation of the project.
   o For residential properties that are part of a homeowners association, condominium association, or civic association, upload an approval letter from the association.
   o For vegetation projects (rain garden, urban tree canopy, pavement removal projects that involve vegetation, and green roofs), upload a detailed planting plan.
   o For permeable pavement projects, upload a document that contains the contracting company name and contact information, the type of permeable pavement to be installed, a design plan and/or detailed sketch that shows what stone/gravel will be used for the sub base, and the height of the sub base.
   o For green roof projects, upload a professional engineer’s stamped plan of the roof design.
Note: Some projects will require permits. The applicant is responsible for acquiring all necessary permits with the Prince George’s County Department of Permitting, Inspections, and Enforcement (DPIE). While permits need not be in hand at the time of application for the rebate, the final inspection report from DPIE must be submitted before a rebate check can be issued and will, therefore, be a condition of the rebate award. Visit their website at https://www.princegeorgescountymd.gov/1024/Permitting-Inspections-and-Enforcement.

For the remainder of the application, complete only the sections that apply to your project.

4. Rain Barrel/Cistern Tab
   - Provide the number of rain barrels/cisterns, size (gallons) of each rain barrel/cistern, and total number of gallons for all rain barrels/cisterns you intend to install.

5. Rain Garden Tab
   - Provide the length, width, and depth of the rain garden you intend to install.

6. Urban Tree Canopy Tab
   - Provide the number of trees and species names for the trees you intend to plant.

7. Pavement Removal/Permeable Pavement Tab
   - Provide the total area (square feet) of pavement you intend to remove and indicate with what you intend to replace the pavement.
   - Provide the total area (square feet) of permeable pavement and the type of permeable pavement you intend to install. Indicate if the system will include stormwater storage and if so, how the system will discharge stored stormwater (e.g., discharge to open area, infiltration, underdrain, tie into public storm drain system).

8. Green Roof Tab
   - Provide the planting depth (inches) and the size (cubic feet) (planting depth multiplied by area of roof divided by 12) of the green roof you intend to install.
   - Provide the make and manufacturer of the green roof system and components and the type of system you intend to install (e.g., integral, modular, plug, other).

Note: All green roof projects will require a stamped structural analysis of the roof system from an engineer. You will also need to obtain a permit from the Prince George’s County Department of Permits, Inspections, and Enforcement. Visit their website at https://www.princegeorgescountymd.gov/1024/Permitting-Inspections-and-Enforcement.

Paper Application

To apply via paper application, download the application form at https://cbtrust.org/prince-georges-county-rain-check-rebate/ or contact us to get a copy mailed to you. Completed paper application forms must contain the original signatures of the applicant and should be mailed to the following address:

Prince George’s County Rain Check Rebate Program
Chesapeake Bay Trust
108 Severn Avenue
Annapolis, MD 21403
Appendix A: Operations and Maintenance

Knowing about the use of each practice and how to maintain them so they look beautiful and continue to function as designed is important. This appendix details the operation and maintenance of the seven Rain Check Rebate practices. In addition, to learn about each practice including details about the seven stormwater practices to help decide what may work best for you as well as what steps are needed to attain a rebate and what is allowable in the program, applicants should review the fact sheet and guidelines document for each practice which can be found at https://cbtrust.org/grants/prince-georges-county-rain-check-rebate/.

Rain Barrels

Rain barrels require periodic maintenance. Drain them after each significant rainfall from April to November. As a general rule, empty the rain barrel every five to seven days. Clean the rain barrel periodically and inspect it for clogs and leaks. If you suspect mosquitoes may be a problem, a fine mesh screen fitted on the lid of the rain barrel will prevent mosquitoes from gaining access and laying eggs. Remove leaves and other debris from the filter screen and ensure that it is not damaged and is securely fastened. Unless designed for freezing temperatures, the rain barrel should be disconnected and drained in the fall or winter, before the first frost, and stored upside-down in a protected location to avoid damage.

Cisterns

Cisterns require periodic maintenance. All cisterns should be designed with multiple access points to support pump maintenance, inspection, repair, and cleaning. Inspect your cistern and its associated components twice per year to ensure that

- downspouts are properly positioned, intact, and free of debris;
- filters and screens are intact and free of debris and sediment;
- tanks and covers are intact and not leaking;
- pumps are working properly;
- overflow outlets are clear and are directed away from building foundations; and
- spigots and hoses are functioning properly.

To maintain adequate storage, cisterns should be drained between significant rainstorms. Clean out the cistern and its inflow and outflow components as part of routine maintenance during dry parts of the year. Unless designed for placement below ground or for freezing temperatures, the cistern should be disconnected and drained in the fall or winter, before the first frost, to avoid damage.
Rain Gardens

Rain gardens require less maintenance compared to traditional gardens. Primary maintenance requirements involve weeding, repair, and replacement of components in the treatment area. The use of native plants reduces fertilizer, pesticide, water, and overall maintenance requirements. During the first growing season, the garden must be watered regularly during dry periods. However, if the soil is moist at a depth of 4 inches, and wilting plants recover at night, watering is not needed. Regularly remove any weeds, litter, sand, and sediment that enter the garden. Weeding should be accomplished routinely, at least monthly during the growing season.

Rainwater entering a rain garden normally carries nutrients, so fertilization is normally not needed; however, if a soil test indicates very low soil fertility, an organic fertilizer may be applied. At least once a year, apply a new layer of double-shredded hardwood mulch, maintaining between 2 and 3 inches of cover. You may need to remove old mulch every year or two to maintain the appropriate depth for your rain garden to function properly. As with any garden, divide overcrowded plants in the spring or fall, and prune dead vegetation annually.

Perennial plants can be cut back in the spring, when new growth starts, if desired for neatness, but it is not required for plant health. Plants can be pinched, pruned, sheared, or deadheaded during the growing season to encourage flowering, bushier growth, or fresh leaves. Diseased or damaged portions of plants should be pruned, as needed, and trees and shrubs can be pruned in the fall for shape or to increase fruit production.

Rain gardens are designed to have water standing for up to four hours. If this period is routinely exceeded, the garden may not be functioning properly. The surface blockage problem can often be corrected by removing the mulch layer and raking the surface. For blocked filter fabric, use lengths of small reinforcing bar (2’-3’ #4 rebar) to puncture the fabric with holes every 1’ on center. If the soils themselves are causing the problem, punch holes in the soil to increase aeration. In a worst-case scenario, the entire rain garden may need to be re-installed. Check where the water enters the garden to be sure it is not being clogged by soil, mulch, or debris; and remove obstructions, as needed. Pet waste should not be left to decay in rain gardens.
Urban Tree Canopy

Aside from watering, trees require minimal maintenance. As part of installation, newly planted trees should be watered and mulched. Continue watering your trees at a rate of 25 gallons per week throughout the growing season (April through September) during dry spells. You may want to use a slow-release watering bag to make watering easier. If you are unsure when to water your trees, follow Casey Trees weekly watering recommendations from [http://caseytrees.org/get-involved/water/](http://caseytrees.org/get-involved/water/). Each week they consult the previous week’s precipitation and streamflow data to determine the condition—dry, normal or wet—and appropriate action to take. Watering recommendations are posted on their homepage and Facebook and Twitter accounts. To ensure long term success, this watering regime should continue throughout the first three growing seasons after installation. Mulching your tree seasonally—and even connecting the area around your tree with a nearby mulched area or planted bed—not only has a beautifying effect, but also provides your tree with a number of sustaining benefits. Be sure, however, to keep mulch and other debris from touching the trunk of the tree. Soil and mulch piled against the top of the root ball and the trunk can invite pests and rot the bark. Correctly applied mulch helps maintain the temperature of the soil, encourages retention of moisture in the root zone, provides important nutrients, and suppresses grass and weeds that can take water and nutrients from your tree. Mulching also creates a barrier that can protect your tree from damage by lawn maintenance machines.

Basic tree care practices such as watering and mulching can be properly done by anyone; however, some tree care is best left up to trained professionals. Examples include work that cannot be performed from the ground; work that cannot be performed with hand tools like pruners, loppers, and pole saws; and any work within 10 feet of any kind of overhead utility line. In addition, pruning or removing trees, especially large trees, can be dangerous work. This type of work should only be completed by those trained and equipped appropriately. Improper pruning can cause more harm than good by introducing disease, causing weak growth, making the tree more vulnerable to storms, and/or creating wounds that weaken or kill your tree.

Pavement Removal

Depending on the size of the project, maintenance requirements will vary considerably, but are typically the same as for other types of landscaping projects. The use of native plants and trees are typically associated with lower maintenance costs. After a garden is established, the frequency and amount of watering will depend on the types of plants installed as well as local weather conditions. Regular activities, such as weeding are also recommended; the use of mulch can reduce the frequency and duration of weeding required. Approximately 2 to 3 inches of mulch should be added annually.

Compared with native vegetation, the maintenance requirements for sod are more frequent, especially during the summer months and growing season. Regular watering may be needed even after the turf becomes
established; watering early in the morning or later in the evening is most efficient. Apply a steady stream of water to ensure adequate infiltration. If you observe runoff, stop watering as this means that the soil is saturated. When mowing, aim for a grass height of 2.5 to 3.5 inches during the summer and 2 inches during the autumn and spring. Cutting more than one third of a grass blade will hinder growth and accelerate the loss of soil moisture. Maintaining a higher grass height (by raising the mower blade) will help reduce the frequency of mowing and provide for a more robust lawn.

Although occasional maintenance will be required, the replacement of pavement with vegetation, whether sod, small trees, or native plants, will provide countless benefits to both the property owner and the local environment.

There are maintenance requirements for permeable pavement or pavers as well. Please see the Permeable Pavement Stormwater management guidelines for more information.

**Permeable Pavement**

As with any structural feature, permeable pavement requires maintenance to ensure that the system continues to function properly. The most common problem impacting permeable pavement is clogging, which occurs when sediment and other material obstructs pores, reducing infiltration. To help prevent these problems, keep landscaped areas well maintained and prevent soil from being transported onto the pavement. The most effective preventive maintenance for permeable pavement is yearly dry weather vacuum sweeping. Brooms, hoses, and pressure washers can compromise the system’s integrity and should not be used for cleaning and clearing. For paving stones, periodically add joint materials (sand) to replace material that has been transported away. Inspect your permeable pavement each year to check for and repair cracking, splitting, or other damage to the pavement surface. Do not reseal or repave with impermeable materials. Grass pavers may require periodic reseeding to fill in bare spots. In winter, salt can be used in moderation to melt ice, but never use sand unless you have paving stones. Pervious concrete works well in cold climates as the rapid drainage of the surface reduces the occurrence of freezing puddles and black ice. Melting snow and ice infiltrates directly into the pavement, facilitating faster melting. Snowplows can catch the edge of grass pavers and some paving stones. Rollers should be attached to the bottom edge of a snowplow to prevent this problem.
Green Roof

Extensive green roofs, when properly installed, require relatively limited maintenance, but they are not maintenance-free. Green roofs require some attention during establishment and yearly maintenance thereafter. Intensive green roofs have irrigation needs and require more maintenance than extensive green roofs. Green roofs require irrigation during the 18-month to 2-year establishment phase, and as needed during drought conditions. Be sure to check gutters and downspouts annually and remove any accumulated sediment or debris. Check surface vegetation and remove undesirable weeds annually; plant replacement is best done in the spring and fall. Weeds and native grasses are carried to the roof by wind, birds, and insects and can compete with roof plants for sunlight, moisture, and nutrients; therefore, they should be weeded annually. Once a year, lightly apply a specially blended, organic, slow-release fertilizer to help keep your green roof functioning efficiently.
